The hemodynamic study was carried out during and after cardiopulmonary bypass in nine mongrel dogs. Left internal thoracic arteries (LITA) had been prepared with End-to-Side-anastomosis (ST-LITA) (n = 5), direct side-to-side anastomosis (DS-LITA) (n = 4) and end-to-side anastomosis with the internal jugular vein (SV-LITA) (n = 5). Coronary sinus and aortic blood flows were measured by a transit time flow meter. During cardiopulmonary bypass, ST-LITA and DS-LITA had better myocardial protection than SV-LITA. ST-LITA and DS-LITA demonstrated significantly higher coronary sinus flow than SV-LITA and coronary blood flow was better preserved in ST-LITA and DS-LITA than in SV-LITA. On the other hand, SV-LITA had the best recovery of coronary circulation after the cardiopulmonary bypass. It is concluded that ST-LITA and DS-LITA have better protective effects on myocardium than SV-LITA. ST-LITA and DS-LIT 1cb139a0ed
